BioProject ID:

Abstract & Study Overview

Histoplasmosis in non-endemic European regions is predominantly diagnosed in immunocompromised travelers or immigrants. Here, whole-genome sequencing was conducted on a primary Histoplasma capsulatum isolate recovered from the bronchoalveolar lavage (BAL) fluid of an HIV-infected patient presenting with severe progressive pulmonary and disseminated histoplasmosis in Germany. Phylogenomic analysis anchored the isolate within the Southeast Asian / Eurasian lineage, resolving specific SNPs and resistance determinants associated with clinical triazole antifungal responsiveness.

Genomic & BioProject Details

- **Organism**: *Histoplasma capsulatum*
- **BioProject Accession**:
- **Data Archive**: NCBI SRA / ENA
- **Scope**: Whole Genome Sequencing (WGS), comparative phylogenomics, and molecular epidemiology.
