Abstract & Study Overview

DNA barcoding is an essential tool for rapid and accurate fungal identification. In the FungID project at the Westerdijk Fungal Biodiversity Institute (CBS-KNAW), whole-genome sequencing and multilocus Sanger sequencing were performed across reference filamentous fungal collections. For Histoplasma capsulatum CBS 136.72 (type strain reference), high-coverage genomic sequencing established baseline diagnostic barcodes and complete ribosomal/protein-coding marker profiles. This comprehensive resource enables species-level distinction within pathogenic Onygenales and provides reference genomic data for medical mycology diagnostics.

Genomic & BioProject Details

- **Organism**: *Histoplasma capsulatum*
- **BioProject Accession**:
- **Data Archive**: NCBI SRA / ENA
- **Scope**: Whole Genome Sequencing (WGS), comparative phylogenomics, and molecular epidemiology.
