BioProject ID:

Abstract & Study Overview

In South America, Histoplasma capsulatum sensu lato (predominantly Histoplasma suramericanum) causes life-threatening endemic mycosis with frequent cutaneous and visceral dissemination. Whole-genome sequencing and assembly of clinical isolate 7090 from Venezuela was performed to characterize genomic variation, secondary metabolite clusters, and thermal dimorphism regulators. Strain 7090 exhibits rapid yeast transition at 37°C, typical microconidial/macroconidial mycelial phase at 25°C, and conserved dimorphism-regulating kinase circuits.

Genomic & BioProject Details

- **Organism**: *Histoplasma capsulatum*
- **BioProject Accession**:
- **Data Archive**: NCBI SRA / ENA
- **Scope**: Whole Genome Sequencing (WGS), comparative phylogenomics, and molecular epidemiology.
